- Caution notes
- Not suitable for use
- Expected additional effects
- Drug the networked exchange of ideas prevention
- Dose skipped in schedule
- In an overdose event
- Storage device
- UK price benchmarking apps and plan B routes
- Juridical status and governance in the United Kingdom

Broad view

Active moiety: sildenafil, usually formulated as sildenafil citrate.

Indication: used to help men with erectile dysfunction (ED) achieve and maintain an erection. The active drug works by inhibiting phosphodiesterase type 5 (PDE5), which increases blood flow to the penis when sexual stimulation is present. It does not trigger sexual arousal on its own.

Cenforce is one branded source of sildenafil found in international supply chains. It is not an MHRA-licensed brand in the UK; see the [legal standing of a person in the United Kingdom](#) section for details on safe and lawful access.

- Typical onset: many people notice effects between 30 and 60 minutes after dosing, though onset can be earlier or later for some individuals.

- Usual duration: effect is commonly observed for up to around four hours after a suitable dose.
- Food effects: a large high-fat meal can slow absorption and delay onset; see [steps to take Cenforce](#) to uncover practical tips.

Readily available strengths

Sildenafil products are typically dispensed in a range of strengths. In everyday clinical practice the most used tablets are 25 mg, 50 mg and 100 mg.

Reports of Cenforce on some supply routes list multiple strengths including 25 mg, 50 mg, 100 mg and higher nonstandard doses. Higher strengths should only be considered after clinical assessment.

- Common starting adult dose: 50 mg taken as needed before sexual activity.
- Titration: patients may be reduced to 25 mg for better tolerability or increased to 100 mg if the lower dose is not effective.
- Frequency: do not take more than one dose within any 24-hour period.

Cenforce usage tips

Follow the prescribed instructions from your prescriber. The guidance below is general and not a substitute for medical advice.

- Timing: take a single tablet roughly 30 to 60 minutes before you expect sexual activity. Some men respond within 15 minutes while others may need up to four hours.
- Administration: swallow the tablet with water; it may be taken with or without food. A heavy, fatty meal may delay the onset of effect.
- A beverage containing alcohol: avoid excessive alcohol as it can reduce effectiveness and increase the likelihood of dizziness.
- Daily versus as-needed use: sildenafil is usually used as required. If you require treatment every day, discuss the alternative choice regimens such as daily tadalafil with your clinician; see [optional choices and Prices across Britain](#) as a basis for comparison.

Precautionary steps

Prior to the process starting sildenafil tell your healthcare provider about your medical history and all medicines you take, including herbal remedies and supplements.

- Allergy: do not take sildenafil if you have had an allergic reaction to it or any tablet ingredient.

- Heart disease: inform your prescriber if you have coronary artery disease, recent heart attack, unstable angina or history of stroke.
- Blood pressure: patients with low blood pressure or uncontrolled hypertension should be assessed pre-operation.
- Organ impairment: severe liver or kidney disease can alter how the drug is handled and may require dose adjustment.
- Sensory changes: sudden vision or hearing loss should prompt immediate discontinuation and urgent medical review; see [potential unwanted effects](#).
- Older patients: age can increase sensitivity to ill effects such as dizziness; monitor closely.
- Driving: do not drive or operate machinery if you experience dizziness, lightheadedness or visual disturbance.

Cases where treatment is not appropriate

There are specific situations where sildenafil must not be used.

- Concurrent use with nitrates or nitric oxide donors (for example nitroglycerin, isosorbide dinitrate or recreational alkyl nitrites). This combination can cause a potentially dangerous drop in blood pressure.
- Co-administration with soluble guanylate cyclase stimulators such as riociguat is contraindicated.
- Known hypersensitivity to sildenafil or any excipient in the formulation.
- Not recommended for children and not routinely indicated for women for ED treatment.
- Severe hypotension or any medical condition that makes sexual activity unsafe; seek medical advice before using. Pharmacists in the UK will screen before supplying certain sildenafil products; see the [how is legal eligibility status determined in the UK](#) section for more on pharmacist assessment.

Possible unwanted effects

Most people tolerate sildenafil well; lingering effects are often mild and temporary.

- Common: chronic head pain, flushing, indigestion or dyspepsia, nasal congestion, lightheadedness, and diarrhoea.
- Occasional: visual changes such as blurred vision or a blue tint, increased facial warmth.
- Serious (seek immediate help): chest pain, collapse or fainting, irregular heartbeat, an erection lasting longer than four hours (priapism), sudden loss of

vision or hearing, and signs of a severe allergic reaction such as swelling or difficulty breathing.

If you experience severe or unexpected symptoms stop the medicine and contact emergency services or your clinician. See [overdose case](#) for symptoms that might require urgent care.

Clinical drug-drug the networked exchange of ideas between medicationss

Sildenafil interacts with a number of medicines. Always declare all prescription, over-the-counter and herbal products to your healthcare professional.

- Nitrates and nitric oxide donors: absolutely contraindicated; see [contraindicating factors in clinical decisions](#).
- Alpha blockers and certain antihypertensives: co-use can increase the risk of low blood pressure. A lower sildenafil dose and careful timing may be advised.
- Strong CYP3A4 inhibitors: agents such as ketoconazole, itraconazole, ritonavir, cobicistat and clarithromycin can raise sildenafil levels and may require dose adjustment or avoidance.
- Other PDE5 inhibitors: avoid combining sildenafil with tadalafil, vardenafil or avanafil.
- Grapefruit juice: may raise sildenafil concentrations and increase side-effect risk.
- Drinks that contain alcohol: can worsen dizziness and impair sexual response.

If you are unsure about a possible the interaction between participants consult your pharmacist or prescriber before starting or stopping any medicine.

Skipped medication dose

Sildenafil for ED is taken as needed rather than on a strict schedule. If you intended to take a dose but missed it, take the tablet when required prior to sexual activity, but do not take more than one dose in a 24-hour period.

Overdose risk

If you suspect that you or someone else has taken too much sildenafil, seek urgent medical attention or contact emergency services.

- Signs that may indicate suspected overdose include severe dizziness, fainting, chest pain, very marked nausea, irregular heartbeat, pronounced visual disturbance or a prolonged painful erection.

Temporary securing storage ensures that valuables stay safe.

- Keep in a normal room temperature range, preferably 20 to 25 C (68 to 77 F).
- Keep tablets in their original packaging, dry and protected from strong light. Avoid storing in humid places such as bathrooms.
- Store in a place unseen and unreachable by children and animals.

Alternatives and UK costings

There are several licensed treatments for erectile dysfunction in the UK. The choice depends on desired onset, duration, side-effect profile merged with the individual's medical history.

- Sildenafil (licensed options)
 - Viagra Connect 50 mg is available as a pharmacy medicine following a pharmacist consultation. Typical retail prices for Viagra Connect 50 mg are approximately 19 to 25 GBP for 4 tablets, 35 to 40 GBP for 8 tablets, and around 60 to 70 GBP for 16 tablets when supplied as a pharmacy (P) medicine.
 - Generic sildenafil sold privately often costs between 0.50 and 2.00 GBP per tablet depending on strength and supplier, with possible consultation fees added.
- Tadalafil (Cialis and generics)
 - Has a longer duration; single doses of 10 to 20 mg may provide effect for up to 36 hours. Private generic prices are commonly about 1 to 4 GBP per tablet; branded Cialis may retail around 5 to 10 GBP per tablet depending on pack size.
- Vardenafil (Levitra and generics)
 - May be tolerated differently by some patients. Private Prices across Britain commonly range from 3 to 8 GBP per tablet.
- Spedra, the brand for Avanafil
 - Often has a rapid onset for some users (15 to 30 minutes). Typical private cost is about 8 to 15 GBP per tablet depending on strength and quantity.

Note about Cenforce: it is not licensed by the UK Medicines and Healthcare products Regulatory Agency (MHRA). UK pharmacies reputable for supply will normally stock MHRA-licensed sildenafil products only. Medicines bought from overseas online sources may vary in quality, could be intercepted at the border and may be unlawful to supply. For safe access use a UK-registered pharmacy or regulated online service see your clinician for advice.

Status of legality in the United Kingdom

The UK classifies medicines into three main legal categories: prescription-only (POM), pharmacy-only (P) and general sales list (GSL). Regulatory obligations and supply rules differ by category.

- Sildenafil regulatory position: Viagra Connect 50 mg is available as a pharmacy (P) medicine and may be supplied after a pharmacist assessment. Most other sildenafil strengths and branded versions remain prescription-only (POM).
- Cenforce: this brand does not appear on the MHRA list of licensed UK medicines. Supplying or advertising unlicensed ED medicines to the UK public without lawful basis may be illegal.
- Personal import rules: bringing small quantities of medication into the UK for personal use can sometimes be permitted, but unlicensed ED products are at risk of seizure and legal complications. Importing for resale without authorisation is an offense.
- Pharmacist screening: when supplying Viagra Connect 50 mg pharmacists will assess for health conditions that forbid use such as nitrate use, significant cardiovascular risk and other safety issues; unsuitable individuals will be referred to their GP.
- Advertising constraints: direct advertising to the public of prescription-only medicines is prohibited under the Human Medicines Regulations 2012.
- Sport and athletes: PDE5 inhibitors are not typically on prohibited lists, but athletes should consult their sport governing body and medical advisors before use and ensure no prohibited substances are combined.

This material provides general information and is not intended as legal or medical advice. For case-specific guidance contact a UK-registered clinician, pharmacist or the MHRA.
