General a short briefing of the material and uses

Tadalafil is the active chemical in products commonly known by the brand name Cialis. It belongs to a class of drugs called phosphodiesterase type 5 (PDE5) inhibitors. By relaxing smooth muscle and improving blood flow in selected tissues, tadalafil is most often prescribed to treat erectile dysfunction (ED) in adult men.

In different formulations and dosing patterns tadalafil can also be prescribed for benign prostatic enlargement symptoms or certain types of pulmonary arterial hypertension when a specialist considers it appropriate. For a description of the interactional flow among participants, see the [Medication-food danger from the reciprocal contact between individuals and guidelines](#) a division in the text. For guidance on lawful purchase and supply in the UK, read the file [Permissible status and buying guidelines](#) subdivision.

Strength levels offered and dosing recommendations approaches

Tablets sold in the UK commonly come in 2 options include the doses are 5 mg, 5 mg, 10 mg, and 20 mg. Two main dosing strategies are used depending on preference and clinical need:

- On-demand dosing: a frequent starting option is 10 mg taken around 30 to 60 minutes before sexual activity. Based on effectiveness and accompanying effects a clinician may increase to 20 mg or reduce to 5 mg.
- Daily dosing: low doses such as 2.5 mg or 5 mg are taken once every day at approximately the same time to maintain continuous effect without planning around each occasion.

Unless your prescriber tells you otherwise, do not take more than one on-demand dose in any 24-hour period.

Safety assurance checks and critical hazard alerts before starting

Before you start anything tadalafil, tell your doctor or pharmacist about any of the following conditions or treatments because they can affect safety or dosing:

- Recent heart attack, unstable angina, severe heart failure or serious arrhythmias.
- Very high or very low blood pressure, or other significant cardiovascular disease that makes sexual activity unsafe.
- Severe disruption of liver function or advanced kidney disease, including dialysis.
- Blood disorders such as sickle cell disease, multiple myeloma or leukemia.
- Active bleeding disorders or active peptic ulcers.
- Inherited retinal disorders (for example retinitis pigmentosa) or prior sudden vision loss.
- Anatomical deformities of the penis (for example Peyronie disease) or a history of prolonged erections.

Do not merge the elements. tadalafil with nitrate medicines of any kind; even occasional nitrate use (including recreational products known as poppers) can cause a dangerous drop in blood pressure. Discuss vascular risk factors such as diabetes, high blood pressure and smoking with your prescriber. Tadalafil is not intended for use by women, and information on pregnancy or breastfeeding is limited; seek individual advice from a clinician if relevant.

How to administer tadalafil

General administration tips:

- Swallow the pills whole with water.
- A high-fat meal can delay the onset of action of an on-demand tablet, so avoid a very fatty meal immediately beforehand if you need the fastest effect.
- For on-demand use, take the tablet roughly 30 to 60 minutes before planned sexual activity; sexual stimulation is still required for an erection to occur.
- For daily therapy, take your tablet at the same time each day. If you happen to forget a dose, see the [advice on the dose was omitted](#)s.
- Store at normal room temperature away from moisture and heat.

Do not exceed the advised dosing frequency unless instructed by your prescriber. If you have questions about how to make the most of using your prescribed product, contact your pharmacist.

Skipped medication administration

If you use tadalafil on an as-needed basis there is no fixed schedule and missing a planned dose has no special rule. If you are on a daily low-dose regimen, take the missed tablet as soon as you remember unless the time for your next dose is near; do not double up to make up for the missed tablet.

ODing — emergency actions

If you suspect an experiencing an overdose seek urgent medical care straight away. Symptoms of experiencing an overdose may include severe dizziness, fainting, chest pain, very fast or irregular heartbeat, persistent nausea or a painful erection lasting several hours.

Contact emergency services or attend your local accident and emergency department if you or someone else has taken too much tadalafil.

What to stay away from during tadalafil therapy

- Avoid excessive alcohol. Large amounts of alcohol can worsen adverse outcomes such as dizziness and low blood pressure and can reduce sexual performance.
- Discuss grapefruit and grapefruit juice with your pharmacist. Grapefruit may increase blood levels of tadalafil and affect how it gets things done.
- Do not combine tadalafil with other ED treatments (for example vacuum devices plus oral drugs, injectable treatments or other oral PDE5 inhibitors) without specific clinical advice.

Untoward effects and when to get urgent help

Commonly occurring unintended consequences are generally mild and may include head pains, flushing, nasal congestion, indigestion and muscle or back pain. If any unintended consequences persist or are troublesome, discuss them with your prescriber or pharmacist.

Seek immediate medical attention if you experience:

- Chest pain, discomfort radiating to the arm or jaw, sudden sweating or fainting while having sex.
- Sudden loss of vision or a serious decrease in eyesight in one or both eyes.
- Sudden drop in hearing or tinnitus with dizziness.
- An erection lasting four hours or more (priapism) or a very painful erection — this is a medical emergency.
- Signs of a severe allergic reaction such as widespread rash, difficulty breathing, or swelling of the face, lips or throat.

Medication-food interacting as a shared activity spans conversations, gestures, and feedback. carry risks and guidelines

Never take tadalafil together with any nitrate-containing product; the combination can cause a marked and realized potentially dangerous fall in blood pressure.

Other medicines and substances that can interact with tadalafil include:

- Certain antibiotics and rifamycins: for example clarithromycin, erythromycin and rifampicin — these can either raise or lower tadalafil exposure depending on the drug.
- Some antifungal drugs such as ketoconazole and itraconazole — these may increase tadalafil concentrations.

- Certain HIV therapies including protease inhibitors and pharmacokinetic enhancers.
- Certain anticonvulsants such as carbamazepine and phenytoin — these may reduce tadalafil levels.
- Calcium channel blockers and other cardiovascular medicines including diltiazem and verapamil — people engage through a series of the process of people engaging. may require health monitoring.
- Alpha blockers used for prostatic symptoms or high blood pressure — starting doses may need adjustment to avoid low blood pressure.
- Grapefruit and grapefruit juice — these can increase tadalafil blood concentrations and should be discussed in liaison with your clinician.

These lists are illustrative but not exhaustive. Always provide a full list of prescribed medicines, over-the-counter products and herbal remedies to the clinician or pharmacist who supplies tadalafil so they can check for people relating to one another between people can shape outcomes..

Different medicines and related formulations

If tadalafil is unsuitable or ineffective there are several other options for erectile dysfunction or related conditions. Consider discussing these with your clinician:

- Sildenafil (widely known as Viagra; in the UK the 50 mg sildenafil preparation is also available over the counter as Viagra Connect).
- Vardenafil (brand names include Levitra) and its generic versions.
- Avanafil with brand name Spedra, which may offer a faster onset of action for some people.
- Local therapies such as alprostadil delivered by injection (for example Caverject) or intraurethral pellets (such as Muse) — these require specialist training and follow-up.
- Non-pharmacological approaches: vacuum erection devices, lifestyle measures (weight loss, smoking cessation, exercise) and psychological therapies including counselling or couples therapy.

Each option differs in onset of action, duration, side-effect profile and cost. Look at the [Prices levels seen in Britain](#) section in order to compare costs and discuss choices with your clinician to select the most appropriate treatment.

Common price range options in the UK (indicative)

Retail prices vary by pharmacy, pack size and whether you buy privately or on the NHS. Figures below are approximate and quoted in pounds sterling (GBP):

- Branded Cialis (10 mg to 20 mg): roughly 20 to 50 GBP for a small pack of 4 tablets; larger packs reduce the per-tablet cost.
- Generic tadalafil (10 mg to 20 mg): approximately 6 to 20 GBP for 4 tablets, depending on supplier and strength.
- Tadalafil 2.5 mg to 5 mg (28-day supply for daily use): around 6 to 25 GBP for generic packs; branded daily products tend to be more expensive.
- Short pharmacy packs of Cialis Together 10 mg: often sold at about 5 to 7 GBP for 2 tablets after pharmacist consultation; larger pharmacy packs typically range 18 to 25 GBP.
- Sildenafil (Viagra Connect 50 mg OTC): commonly 19 to 25 GBP for 4 tablets, or 30 to 40 GBP for 8 tablets.
- Spedra, brand for Avanafil: price per tablet varies widely, often 15 to 40 GBP depending on strength and source.

On the NHS in England, prescribing of ED drugs is generally restricted and governed by local formularies; private purchase is common. Scotland, Wales and Northern Ireland have separate policies and access may differ. If you consider importing medicines or buying from online pharmacies outside the UK would you mind checking this? MHRA guidance and ensure the supplier is legitimate.

Official status in law and rules for purchasing in the UK

- The majority of tadalafil products are classified as Prescription Only Medicines (POM) and require a valid prescription issued by a UK clinician or a UK-based online prescriber working with a registered pharmacy.
- One specific product, Cialis Together 10 mg, has been reclassified in the UK as a Pharmacy (P) medicine for men aged 18 and over, allowing sales after a pharmacist consultation that confirms suitability and safety. Other tadalafil preparations remain POM.
- Buy only from pharmacies that display their registration (for example GPhC credentials) and avoid suppliers who offer prescription medicines without a consultation or without clear registration details.
- Importation and customs rules apply to medicines ordered from abroad; personal imports may be restricted and subject to MHRA and customs checks. Always verify prior to action. current guidance before ordering from overseas.

- Athletes should check anti-doping rules with UK Anti-Doping in addition to their sporting authority, since permitted substances and testing regulations can change.

Before buying peer review safety alongside the reciprocal contact between individuals information in this page, notably the sections on [safety checks](#) and [collaborative interactions in the user journey shape satisfaction](#). If in doubt, consult your GP or a pharmacist registered in the UK.

FAQs and rapid assistance

How quickly does tadalafil start to work and how long do effects last?

On-demand tablets generally start to work in about 30 to 60 minutes. In many people the effect can last for up to 36 hours, which has led to the informal nickname "the weekend pill". Daily low-dose regimens provide ongoing readiness without timing doses to events.

Is drinking alcohol while on tadalafil advisable?

Light to moderate alcohol consumption may be tolerated by some people, but heavy drinking raises the risk of dizziness, low blood pressure and reduced sexual performance. See [things to bypass](#) for expanded instruction.

Should I avoid grapefruit with tadalafil?

Grapefruit and grapefruit juice can increase blood levels of tadalafil for some people. Talk to your pharmacist or prescriber about dietary global teams rely on robust collaborative interactions.; see the [interplay between parties fuel collaboration and innovation](#). the section with details.
